

Consistent risk management strategy for your retail locations on a worldwide basis.

Recognize, understand and take action against common retail store property hazards.

Reducing “shrinkage” is a big focus for you when it comes to preventing property loss at your retail stores. In addition to theft, there are other perils that can have an adverse effect on your retail store operations. This course helps educate store managers on the loss drivers most likely to affect their operation other than theft: fire, water leakage, wind and flood.

Throughout the training module users will be asked questions specifically about their store location. The responses to these questions are used to develop a custom loss prevention and risk management plan with actions that can be done right now, as ongoing maintenance, during and after a loss.

Upon completion of the course, users will be able to:

- Recognize the sources of fire, water leakage, wind and flood property hazards
- Identify the impact these hazards can have to their operation.
- Identify ways they can prevent and control damage caused by one of these hazards.
